SAMPLE POSITIONING OF PORTABLE LOOP UNIT

At a kiosk, cashier counter, or reception desk, the personal hearing loop can be positioned behind glass or Plexiglas, but should be as close to the telecoil user as possible. An auxiliary, plug-in microphone can pick up the staff person's voice if more sound is needed than is provided by the unit's internal microphone or if the loop is placed on the telecoil user's side of the barrier.

An additional plug-in microphone can capture a voice at the far end of a conference table, book club meeting, or outside family gathering.
Useful any time a telecoil user is "distanced more than 6 feet from a speaker – but especially so during COVID recommendations!

Medical reception desks at
Hearing Life and
The Eye Center
provide counter loops
that both allow social distancing
through the Plexiglas barrier and
comply with HIPPA privacy.

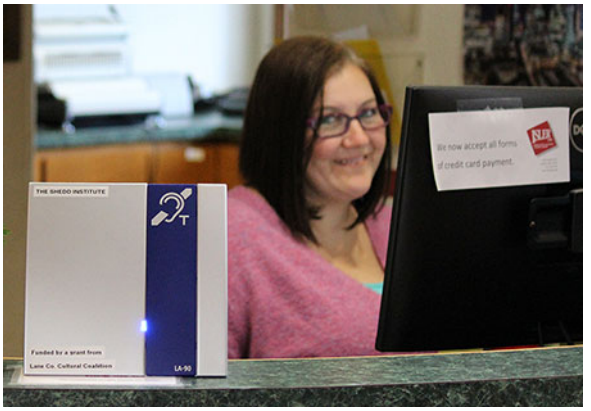

Hearing specialists offices,
such as Hearing Associates,
use a portable loop to demonstrate the effect of
a telecoil and to practice accessing the program.
